

The Percivia PER.C6® Development Center develops the PER.C6® human cell line for recombinant proteins. PERCIVIA offers an integrated technology platform for protein production and provides customers a hands-on experience of the PER.C6® technology. The PER.C6® platform encompasses cell line generation technology, cell culture development, and downstream processes, design, scale-up, technology transfer, and regulatory support. High yields in combination with the fully human glycosylation properties, make the PER.C6 cell line an attractive platform for the production of proteins, including monoclonal antibodies.

Protein Scientist, Glycan Analysis-Job Code 6100-03-08

Provide mass spec expertise to characterize protein products and impurities and provide critical analytical analysis for cell line generation and process development. You will study glycosylation, protein folding and secretion to enhance recombinant protein productivity and quality. You will independently develop methods for structural characterization and identification of proteins/peptides using multiple mass spectrometry instrumentation. You will also be responsible for developing and executing a wide variety of biochemical and biophysical methods for protein analysis, including HPLC (size exclusion, ion-exchange, reversed-phase, etc), SDS-PAGE, IEF, UV-Vis spectroscopy, fluorescence spectroscopy, and calorimetry.

A successful candidate will have a MS or PhD degree in Biochemistry, Analytical Chemistry or related field with a minimum of 2 years experience in industry. An in-depth knowledge of mass spectrometry and intensive hands-on experience is required. Experience with bioinformatics/database tools for interpretation of MS data is also required. Experience with chromatographic and electrophoretic techniques is preferred. Basic knowledge of protein structure and function is essential. Expertise in glycan analysis and other bioanalytical techniques used to characterize and conduct early phase pre-formulation is required.
